

The funnel (Stim8hr)

3,935

knockdown-gated, program-significant genes (universe A)

22,039

eligible (gene, disease) pairs admitted by the gate

43

positive disease hop + passing effect

30

clean full-chain survivors

43 = 30 clean + 10 supported-weak + 3 supported-flagged

(+ 1 refuted-effect; 21,995 refuted for the specific disease)

Caveats (restated in Results):
the referee ALONE supports 395/47,220 pairs;
the novelty gate culls 395 -> 43. Within the funnel
the program hop cannot fail (refuted_program $\equiv$ 0),
and '43 supported' is a JOINT gate $\times$ referee count.

Verdict ledger (spans the verdict space)

NAB2 -> atopic eczema

supported

full chain; eczema clusters OR 3.90/3.43

EGR2 -> asthma

supported

effect -11.06, 854 DE; asthma OR 20.4

NUDT1 -> T1D

supported-weak

chain holds, trivial effect (4 DE); only zero-lit survivor

IL2 -> (Rest)

untested

0/2 guides significant; nothing to knock down

SLC1A5 -> T1D

refuted

9 disease gene-sets, none FDR<0.05 (best 0.054)

untested (IL2) = abstention; refuted (SLC1A5) = the confident, receipt-backed no.
