

Diagnostics of the referee's behavior (Stim8hr) -- not a validation

A. Control 2 -- disease-hop label-shuffle null

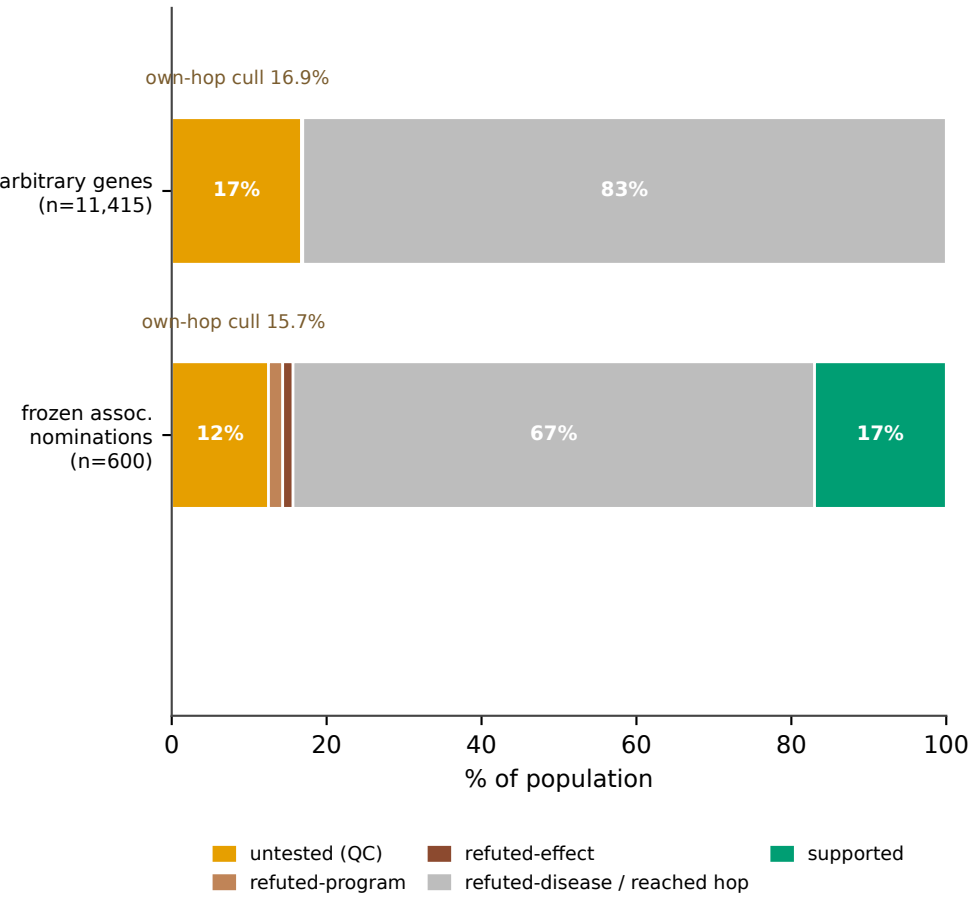

Observed sits BELOW null (lower-tail $p \approx 5 \times 10^{-4}$): the near-total refutation is substrate-inherited, not the referee's own discrimination.

B. C10 gate grid -- clean survivors & NAB2 rank

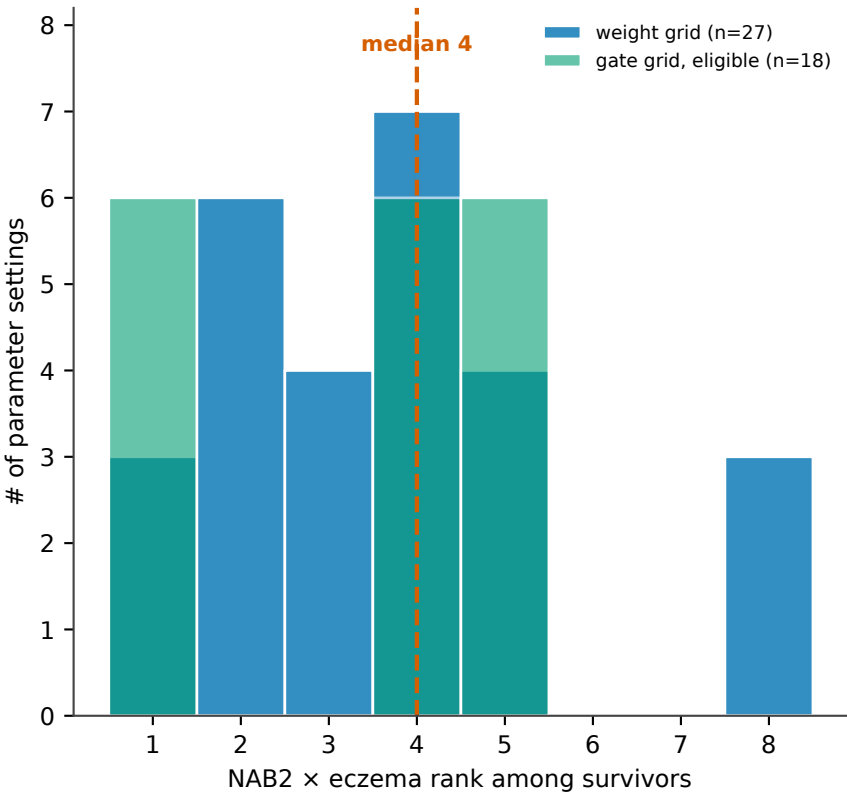

Cell = clean survivors; 'R#' = NAB2×eczema rank, 'x' = pruned. Rank stays 1-5 (median 4) wherever eligible; drops out only at the 0.75 literature floor.

C. C2 -- the referee's own edge (out-of-funnel)

D. Control 3 -- flagship rank stability

Across 27 objective-weight settings NAB2 ranks 1-8 (median 4; top-5 in 89%); across gate cells where eligible, rank 1-5. The verdict is invariant in all.

Curated-association top guesses include IL36RN×psoriasis (0.82), TREX1×lupus (0.78), PADI4×RA (0.68) -- all UNTESTED (failed KD QC). Control 1: all 2,430 failed-KD genes returned untested (100%, 0 leaks).
